

Data Dictionary – Task 1: Data Immersion & Wrangling

This document describes the structure, meaning, and business relevance of each variable in the uploaded sales dataset.

Dataset summary: 1,000 rows and 12 columns. The dataset contains sales transactions with customer, product, geographic, quantity, pricing, and revenue information.

Column Name	Data Type	Description	Business Relevance
Order_ID	String	Unique identifier assigned to each order/transaction	Order tracking, identification and auditing
Order_Date	Date	Date on which the order/transaction was placed	Time-based sales and trend analysis
Customer_ID	String	Unique identifier associated with each customer	Customer tracking and purchase analysis
Customer_Name	String	Name or label used to identify the customer	Customer segmentation and reporting
Age	Float	Age of the customer in years	Age-wise customer and purchasing analysis
Gender	String	Gender of the customer	Gender-based customer and sales analysis
City	String	City where the customer/order is associated	Geographical sales and customer analysis
Product	String	Product purchased by the customer	Product performance and demand analysis
Category	String	Category to which the purchased product belongs	Category-wise sales and performance analysis
Quantity	Integer	Number of units purchased in the order	Demand and volume measurement
Unit_Price	Float	Price of one unit of the purchased product	Pricing and revenue analysis
Total_Sales	Float	Total sales value generated by the order	Revenue calculation and sales performance

Note: The uploaded dataset contains some missing values in Age and City; these should be considered during the data-wrangling/cleaning stage.
